

More and more modern televisions are dispensing with conventional audio outputs. This trend is leading to ever greater challenges, especially when it comes to audio integration and subsequent volume control. We are therefore delighted to introduce the brand new I/O-HDMI module, which is equipped with an HDMI ARC input.

With the new I/O-HDMI module, you can easily connect the TV via HDMI cable and solve the annoying problems with the volume control on the M30 Multiuser Amplifier. Simply use the original TV remote control to control the volume.

According to the multiuser logic, the TV sound is then also available to the entire system and can be distributed to other rooms. Thanks to the factory-set CEC triggers, which can be further customized in the Configurator, the M30 Multiuser Amplifier reacts automatically to TV control commands.

The most important facts at a glance:

- only compatible with the M30 Multiuser Amplifier
- requires multiuser version 0.6.2 or higher
- HDMI ARC input replaces coaxial input
- Audio sensitive analog and optical input
- Analog output with separate DSP

You can download the data sheet for the new I/O-HDMI Module [here](#) or visit our homepage and support page.

Previous Multiuser I/O Module

The previous I/O Module remains part of our product range and is now available at an even more attractive price. The RRP for the proven I/O Module is now 220.- €.

Revox Multiuser I/O Module

Order no: 156308000

Price: 220.- € incl. VAT

A new software update 0.6.2 for the Multiuser 3.0 system is currently available on our online update server.

This update is automatically installed in the background on the **STUDIOMASTER M500 / STUDIOMASTER M300 / V400 Multiuser Server** if the last update with OS version 0.6.1 has already been activated. After version 0.6.2 has been installed on the system, an update icon appears in place of the settings icon at the top left of the app. Touching the update icon opens the settings with the device list. The update only takes effect when the update icon is acknowledged by tapping it and the system is restarted.

The most important new features and adjustments in version 0.6.2:

Integration of I/O-HDMI Module

The latest multiuser update, version 0.6.2, includes all enhancements for the system and Configurator that enable the use of the new I/O-HDMI Module

Adjustments in the Configurator

Some functions have been adapted and improved in the Multiuser Configurator. The global labeling function in the hardware view for service names and aliases has been reactivated, text commands with :zone content have been added to the directory and the local flag function (local sources only visible if room is selected) has been removed.

Further improvements

The Spotify Connect interface has been updated because sometimes the song information in the Play View was not updated after changing songs. Furthermore, the incorrect behavior or multiple triggering of the next/previous and mute multiuser text commands in combination with zones has been corrected.

The complete overview of all adjustments can be found in the current changelog document [here for download](#) or in the Multiuser App under Revox Info - Changelog.

There is currently no update for the Multiuser App, the version remains at 3.0.7.
