Dear Revox Partner,

In this newsletter we would like to introduce you to the brand new Multiuser Update, as well as share some important information about our Smart Home License.

Read the details below and take advantage of these new opportunities for your customer meetings.

Best regards

Your
Revox Team

Multiuser 3.0 Update

Software Update 0.6.4

A new software update 0.6.4 for the Multiuser 3.0 system is currently available on our online update server.

This update is automatically installed in the background on the **STUDIO**MASTER M500 / **STUDIO**MASTER M300 if the last update with OS version 0.6.2 has already been activated (for V400 Multiuser Server version 0.6.3).
Once version 0.6.4 has been installed on the system, an update icon appears in place of the settings icon in the top left of the app. Touching the update icon opens the settings with the device list.
The update only takes effect when the update icon is acknowledged by tapping it and the system is restarted.

The most important new features and adjustments in version 0.6.4:

- New global multiuser setting: Menu mode
  The menu mode can now be set via the settings in the MU3 app under the multiuser settings. There are three different modes to choose from:
  default: as before, and also the default setting, all menus and settings are open and visible
  basic: simplified menu navigation, fewer settings, suitable for normal end users
  locked: changes to the system are no longer possible (settings locked - children/customer security): Can only be locked and unlocked with a password.
- Spotify trigger functionality added. Systems can now be switched on or taken over via Spotify when the trigger is activated.
- All music sources can now also be added directly to the user favorites folder.
- DSP presets in configurator extended with Botanic series.
- Various small improvements and bug fixes

App Update 3.0.8

What's new in the Multiuser App

- Browser view: Unwanted animation/jumps in the browser view for users/Internet sources corrected.
- Volume: Volume rocker operation improved. The rocker can now be moved over the entire range and does not automatically jump to the left or right stop.
- Playlist button: "Playlist" button in the player view changed to playlist icon button and an animation added to visualize the player list when used.
- Revox Connect: "Repeat" button added to Revox Connect view.
- Various small improvements and bug fixes

All other new features for the software and app can be found in the changelog. Available on our support page or as a download here.

Smart Home License

The Smart Home License allows KNX and Smart Home plugins/modules to access a Multiuser 3.0 server. This does not apply to the Revox Multiuser 3.0 KNX Gateway, which also works without a Smart Home License. The license is generated by Revox for each device and can be entered in the Device Service in the Multiuser 3.0 Configurator. The Multiuser Server then allows communication with a plug-in or module. In terms of the functional principle, entering the Smart Home License is identical to entering an additional user license on a V400 Multiuser Server.

For multiserver solutions, i.e. multiuser systems with several servers, only one Smart Home License is required. This means that only one Smart Home License is required in the system, even if several **STUDIO**MASTER M300/M500 or V400 are integrated.

> *Please note:* The option to enter the Smart Home License in the Multiuser 3.0 Configurator only appears now with the new Multiuser Update. Up to this point, the HomeServer plugin also worked without a valid Smart Home License. Enter the license key in the Configurator immediately after this update, otherwise communication between the Multiuser system and Smart HomeServer will be suppressed.
